

**GENERAL DESCRIPTION**

The SPX29300/01/02 are 3A, highly accurate voltage regulators with a low dropout voltage of 600mV (typical) at 3A.

These regulators are specifically designed for low voltage applications that require a low dropout voltage and a fast transient response. They are fully fault protected against over-current, reverse battery, and positive and negative voltage transients. On-Chip trimming adjusts the reference voltage to 1% initial accuracy.

The SPX29300 is offered in a 3-pin TO-263 package, the SPX29301 is offered in a 5-pin TO-263 while SPX29302 is offered in a 5-pin TO-263 and 5-pin TO-220 packages.

**APPLICATIONS**

- **Adjustable Power Supplies**
- **Constant Current Regulators**
- **Audio and Video/Graphic Cards**
- **Battery Chargers**

**FEATURES**

- **3A Guaranteed Output Current**
- **Low Dropout Voltage of 600mV @ 3A**
- **Adjustable Output down to 1.25V**
- **1% Output Accuracy**
- **Tight Load and Line Regulation**
- **Fast Transient Response**
- **Reverse Battery Protection**
- **Zero Current Shutdown (SPX29301/02)**
- **Power Good Flag (SPX29301)**
- **Lead Free 3-Pin TO-263, 5-pin TO-220 and TO-263 Packages**

**TYPICAL APPLICATION DIAGRAM**

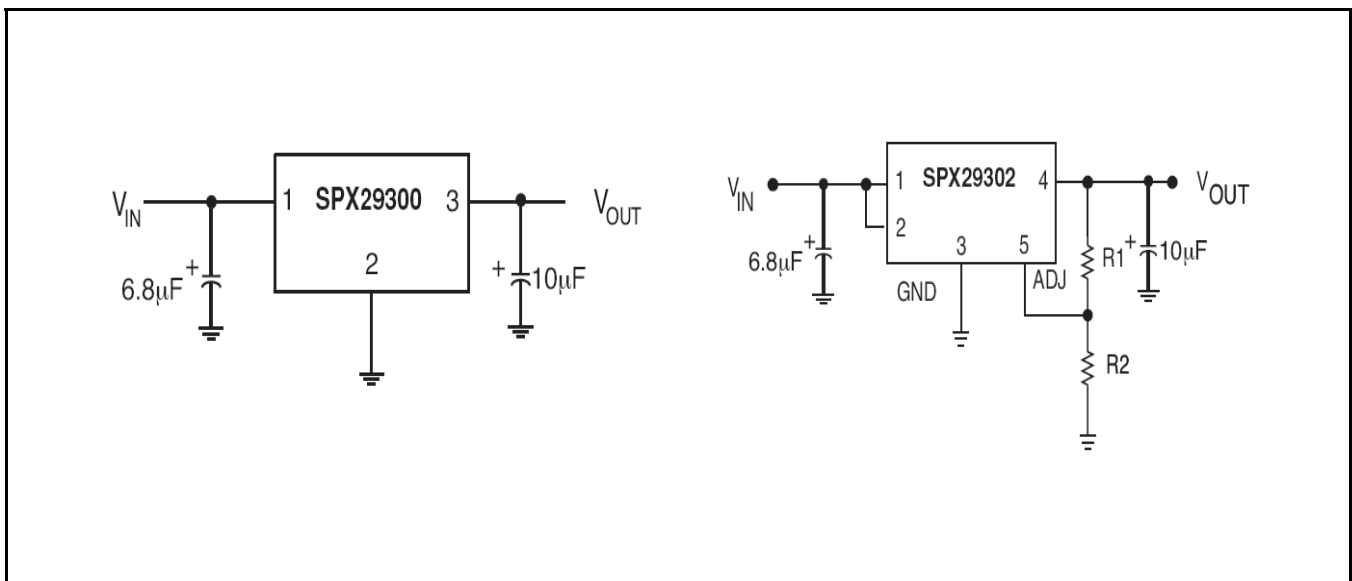

Fig. 1: SPX29300 and SPX29302 Application Diagrams

**ABSOLUTE MAXIMUM RATINGS**

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

Input Voltage  $V_{IN}^1$  ..... 20V  
 Storage Temperature ..... -65°C to 150°C  
 Lead Temperature (Soldering, 5 sec) ..... 260°C  
 ESD Rating (HBM - Human Body Model) .....  
 All pins except EN ..... 2kV  
 En pin ..... 1kV

**OPERATING RATINGS**

Input Voltage Range  $V_{IN}$  ..... 16V  
 Junction Temperature Range ..... -40°C to 125°C  
 Thermal Resistance .....  
 TO-220-5 Junction to Ambient ..... 29.3°C/W  
 TO-263-3 Junction to Ambient ..... 31.4°C/W  
 TO-263-5 Junction to Ambient ..... 31.2°C/W  
 TO-220-5, TO-263-3, TO-263-5 Junction to Case.. 3°C/W

Note 1: Maximum positive supply voltage of 20V must be of limited duration (<100ms) and duty cycle of less than 1%. The maximum continuous supply voltage is 16V.

**ELECTRICAL SPECIFICATIONS**

Specifications with standard type are for an Operating Junction Temperature of  $T_J = T_A = 25^\circ\text{C}$  only; limits applying over the full Operating Junction Temperature range are denoted by a “•”. Minimum and Maximum limits are guaranteed through test, design, or statistical correlation. Typical values represent the most likely parametric norm at  $T_J = 25^\circ\text{C}$ , and are provided for reference purposes only. Unless otherwise indicated,  $V_{IN} = V_{OUT} + 1\text{V}$  and  $I_{OUT} = 10\text{mA}$ ,  $C_{IN} = 6.8\mu\text{F}$ ,  $C_{OUT} = 10\mu\text{F}$ ,  $T_A = 25^\circ\text{C}$ .

Parameter	Min.	Typ.	Max.	Units	Conditions
<b>Fixed Voltage Versions</b>

<b>Enable Input – SPX29301/02</b>						
Input Logic Voltage Low (OFF)			0.8	V	• V <sub>IN</sub> <10V	
Input Logic Voltage High (ON)	2.4					
Enable Input Pin		100	600	μA	• V <sub>EN</sub> =16V	
			750			
			1			• V <sub>EN</sub> =0.8V
			2			
Regulator Output Current in Shutdown		10	500	μA	• Note 9	

Note 2: Full load current (I<sub>FL</sub>) is defined as 3.0A.

Note 3: Dropout voltage is defined (V<sub>IN</sub>-V<sub>OUT</sub>) when the output voltage drops to 99% of its nominal value.

Note 4: V<sub>IN</sub>=V<sub>OUT</sub>(nom)+1V. Use pulse-testing procedures to minimize temperature rise.

Note 5: Ground pin current is the regulator quiescent current. The total current drawn from the source is the sum of the load current to the ground current.

Note 6: Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range

Note 7: Thermal regulation is defined as the change in output voltage at time T after a change in power dissipation is applied, excluding load/line regulation effects. Specifications for a 200mA load pulse as V<sub>IN</sub>=20V (a 4W pulse) for t=10ms.

Note 8: Comparator threshold is expressed in terms of a voltage differential at the Adjust terminal below the nominal reference voltage measured 6V input. To express these thresholds in terms of output voltage change, multiply the error amplifier gain = V<sub>OUT</sub>/V<sub>REF</sub> = (R1 + R2)/R2. For example, at a programmable output voltage of 5V, the Error output is guaranteed to go low when the output drops by 95mVx 5V/ 1.240V = 383mV. Threshold remain constant as a percent of V<sub>OUT</sub> as V<sub>OUT</sub> is varied, with the dropout warning occurring at typically 5% below nominal, 7.7% guaranteed.

Note 9: V<sub>EN</sub> ≤ 0.8V and V<sub>IN</sub> ≤ 16V, V<sub>OUT</sub> = 0.

 $V_{OUT}=3.3V$

**THEORY OF OPERATION**

The SPX29300/01/02 incorporates protection against over-current faults, reversed load insertion, over temperature operation, and positive and negative transient voltage.

**THERMAL CONSIDERATIONS**

Although the SPX29300/01/02 offers limiting circuitry for overload conditions, it is still necessary to insure that the maximum junction temperature is not exceeded in the application. Heat will flow through the lowest resistance path, the junction-to-case path. In order to insure the best thermal flow of the component, proper mounting is required.

**TO-220 DESIGN EXAMPLE:**

Assume that  $V_{IN} = 10V$ ,  $V_{OUT} = 5V$ ,  $I_{OUT} = 1.5A$ ,  $T_A = 50^{\circ}C$ ,  $\theta_{HA} = 1^{\circ}C/W$ ,  $\theta_{CH} = 2^{\circ}C/W$ , and  $\theta_{JC} = 3^{\circ}C/W$ , where:

$T_A$  = ambient temperature,

$\theta_{HA}$  = heatsink to ambient thermal resistance

$\theta_{CH}$  = case to heatsink thermal resistance

$\theta_{JC}$  = junction to case thermal resistance

The power calculated under these conditions is:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} = 7.5W$$

And the junction temperature is calculated as

$$T_J = T_A + P_D \times (\theta_{HA} + \theta_{CH} + \theta_{JC})$$

or

$$T_J = 50 + 7.5 \times (1 + 2 + 3) = 95^{\circ}C$$

Reliable operation is insured. Capacitor Requirements

**CAPACITOR REQUIREMENTS**

The output capacitor is needed to insure stability and minimize the output noise. The value of the capacitor varies with the load. However, a minimum value of 10µF aluminum

capacitor will guarantee stability over all load conditions.

A tantalum capacitor is recommended if a faster load transient response is needed. If the power source has high AC impedance, a 0.1µF ceramic capacitor between input & ground is recommended.

**MINIMUM LOAD CURRENT**

To ensure a proper behavior of the regulator under light load, a minimum load of 5mA for SPX29300/01/02 is required.

**ADJUSTABLE REGULATOR DESIGN**

The SPX29300/01/02 is an adjustable regulator that can be programmed to any value between 1.25V and 16V using 2 external resistors, R1 and R2. The relationship between the resistors and the output voltage is:

$$R_1 = R_2 \times \left( \frac{V_{OUT}}{1.240} - 1 \right)$$

**ERROR FLAG**

The SPX29301 features an error flag that indicates either an over current or under current voltage condition. The flag output goes low, sinking 10mA when either conditions occurs.

**ENABLE INPUT**

The SPX29301/02 has an Enable function that switches the regulator on and off. Their thresholds are TTL compatible. When the regulator is active, approximately 20µA flows through the Enable pin.

**TYPICAL APPLICATION CIRCUITS**

Figure 1 represents the typical implementation for an adjustable output regulator. The values of R1 and R2 set the output voltage value as follows:

$$V_{OUT} = V_{REF} \times \left( 1 + \frac{R_1}{R_2} \right)$$

A minimum value of 10kohms is recommended for R2 with a range between 10kΩ and 47kΩ.
